Abstract of **CN1241574**

The present invention relates to gene engineering technology. Technologically, the present invention features that hybrid tumor technology is first utilized to prepare mouse-originating monoclonal antibody HAb25 with specific combination activity to human liver cancer cells; and HAb25 is re-constructed through gene engineering process into liver cancer resisting single stranded antibody scFv25 and liver cancer resisting bifunctional antibody pBV220-scFv25-PE40 and pGEX4T-1-scFv25-TNF α . The liver cancer resisting gene engineering antibody has the features of small molecular weight, strong penetration capacity, high molecule stability, low toxic side effect, high efficiency, easy mass production, etc., and thus has great latent clinical application capability.
